

## **Wastewater Project Update August 2010**

Development work on the project is continuing. The final design for the collection system and the treatment plant have been completed and are being reviewed by the funding agencies. Financial commitments have been secured for the project, but the City is also seeking more favorable terms in terms of larger grants and lower interest loans. The projected financing model changes with the funding agency commitments. Under the current structure it is likely that the local improvement assessment may go above previous predictions.

If progress continues along the projected path, contracts for construction of the collection system and the treatment system will be finalized in October. The first stages of construction would begin in November. Serious construction would begin spring 2011. Work on the collection system is expected to be done in the fall of 2011. Once construction begins on the collection system, the next design work will be work on the individual STEP tanks on residential and commercial property. The first steps will be a property by property visit to assess the existing tanks and a discussion of where new tanks might be located.
